

The MiniBox+™ Meets All ERS Recommendations for Lung Function Testing During COVID-19

Based on the official "Recommendations from ERS Group 9.1 (Respiratory function technologists/ Scientists) for lung function testing during COVID-19 pandemic and beyond," the MiniBox+ is:

- ✔ Compliant with all ERS Group 9.1 safety recommendations for COVID-19.
- ✔ The most efficient complete PFT device on the market, with minimal downtime between patients.

Here's why:

	ERS Group 9.1 Recommendations for Level 1+2 Safety Phases	MiniBox+
Spirometry & DLCO - not in a Body Box	Permitted only with a bacterial/ viral filter.	Uses fully compliant bacterial/ viral filter.
Lung Volumes & DLCO - in a Body Box	May be performed ONLY "if droplet contamination can be contained, and local national guidelines support this."	Disinfecting is achieved by wiping down the exterior of the device.
Expected downtime between patients	Allow 30-60 minutes for post-test cleaning/decontamination procedure, including device re-calibration and 15+ min for room ventilation.	Post-test cleaning/decontamination wipedown takes 5 minutes. No need for device re-calibration. Mobility maximizes patient flow, with no downtime during room ventilation.

So contact us today for a virtual demo and learn how you too can perform complete PFT – safely – during COVID-19 and beyond.
